

## Area Measurement

With margins so tight and so much income now based on environmentally managed areas or area based contracts, accurately measuring areas is vital.

Survey quality DGPS is a good method of measuring areas; it is the way the department do it. The benefit of this approach is that one can measure with an offset. So it is possible to measure 1 metre outside the drilled area by setting the offset and walking the drilled area, for example.

We have powerful GIS systems that allow us to do all sorts of complex operations on the maps. For example drawing a buffer along a watercourse and calculating the area and perimeter.

Most of our work is in measuring areas of higher value crops. We also map environmental schemes and simply map and measure whole farms.
